

Security engineer working across endpoint, network, and application layers – from macOS MDM and DLP enforcement to WAF hardening against OWASP Top 10 and ML-driven intrusion detection. Comfortable moving between operations and engineering: triaging live incidents one day, shipping the tooling that reduces them the next.

education

FPT University

Bachelor of Information Assurance

GPA: 3.2/4

Honorable Student Award – 3 trimesters

IIG VIETNAM

TOEIC

Score: 825/990

professional experience

TRUSTING SOCIAL

SecOps Engineer Intern

May 2026 – August 2026

- Monitored and triaged **5 security incidents/month** using ClickStack SIEM, which aggregates logs from Cloudflare Zero Trust, Jamf, Chrome, Netwrix Endpoint Protector for unified visibility and analysis then tuned detection rules to suppress false positives and reported findings to the SecOps lead.
- Designed and built an internal XDR system to ingest, correlate, and visualize logs from multiple sources via an interactive source-correlation map and incident timeline – giving analysts full situational awareness – and integrated AI capabilities for automated incident analysis and risk assessment.
- Conducted deeper research, configured **~20 rules**, and validated **90+ test cases** for Netwrix Endpoint Protector DLP and Google Calendar DLP policies to strengthen data-loss prevention coverage.
- Configured and tested Cloudflare Zero Trust security rules to validate policy effectiveness, access controls and prevent data leak through Github.
- Leveraged Claude AI, Claude Cowork, Claude Code in daily workflows to accelerate research, documentation, and analysis tasks, improving overall work efficiency and productivity around **30-50%**.

Skills:

- macOS Endpoint Security, MDM Solutions (Jamf, Mosyle, Netwrix), DLP Configuration & Testing, SIEM Monitoring (ClickStack), Cloudflare Zero Trust, Log Analysis, AI-Assisted Productivity, Security Automation

VIETTEL IDC

IDC Security Engineer Intern

July 2025 – October 2025

- Onboarded customer websites to **Viettel Cloudrity** and fine-tuned protection rules to meet each client's requirements.
- Deployed and configured **Cloud WAF (Radware)** to defend against DDoS, SQL injection, brute-force, and other attacks mapped to the **OWASP Top 10**.
- Built and optimized security rules, including signature-based protection, custom signatures, rate limiting, and API protection.
- Conducted vulnerability testing with **Burp Suite**, **OWASP ZAP**, and **Kali Linux**, and analyzed logs to assess the effectiveness of threat mitigation.
- Implemented **Data Loss Prevention (Fortra)**, defined data-classification rules, and enforced policies to block unauthorized copying, printing, uploading, or emailing of sensitive content.

Skills:

- WAF Configuration, OWASP Top 10 Mitigation, API Protection, DDoS Defense, Vulnerability Assessment, Log Analysis, Data Loss Prevention, and Data Classification

personal project

ERP

Issued by Hien Concept

- Built and secured a production multi-tenant ERP (~**130K LOC TypeScript**, **78 tables**, **30x12 RBAC** with per-tenant isolation, processing customer PII and payroll data); ran an **OWASP Top 10 audit** that found and fixed **42 vulnerabilities**, including **2 Criticals** (unauthenticated object-storage exfiltration, privilege escalation to admin) and an entire class of cross-tenant IDOR.

Hybrid Network Intrusion Detection System

Issued by FPT University

Capstone Project · Grade: 8.5/10 · [Github](#)

- Built a hybrid Suricata + ML network intrusion detection system in Python on the ELK Stack: a DT/RF/XGBoost ensemble reaching **99.46% accuracy** (0.9946 F1) on CICIDS2017, performing real-time detection on Suricata flow logs with statistical and behavioral analysis (port scan, brute force) and automated Telegram alerting, validated against simulated Kali Linux attacks.

Keylogger – Proof-of-Concept (Academic)

Issued by FPT University

- Designed an academic proof-of-concept keylogger embedded in a Snake game to demonstrate how attackers can capture keystrokes and harvest stored credentials (e.g., Chrome-saved passwords) and exfiltrate them via Telegram built to raise defensive awareness and inform detection strategies.
